Question 1 of 5 — Correct

What is the water cycle?

- [x] The continuous movement of water between the Earth's surface, atmosphere, and underground.
- [ ] The process of water turning into ice only.
- [ ] The movement of air around the Earth.
- [ ] The collection of water in rivers and lakes.

Explanation: The water cycle is the continuous movement of water between the Earth's surface, atmosphere, and underground.

Question 2 of 5 — Incorrect

Which process turns liquid water into water vapor?

- [ ] Precipitation
- [x] Condensation
- [x] Evaporation
- [ ] Collection

Explanation: Evaporation is the process that turns liquid water into water vapor (gas).

Question 3 of 5 — Correct

What is precipitation?

- [x] Water falling from the atmosphere to the Earth's surface.
- [ ] The heating of water by the sun.
- [ ] The cooling of water vapor into liquid.
- [ ] Water soaking into the ground.

Explanation: Precipitation is water (such as rain, snow, sleet, or hail) that falls from the atmosphere to the Earth's surface.

The Water Cycle

Summary

Completed

The water cycle is the continuous movement of water between the Earth's surface, atmosphere, and underground. It changes water from liquid to gas to solid and back again, helping to distribute and recycle water across the planet.

How It Works

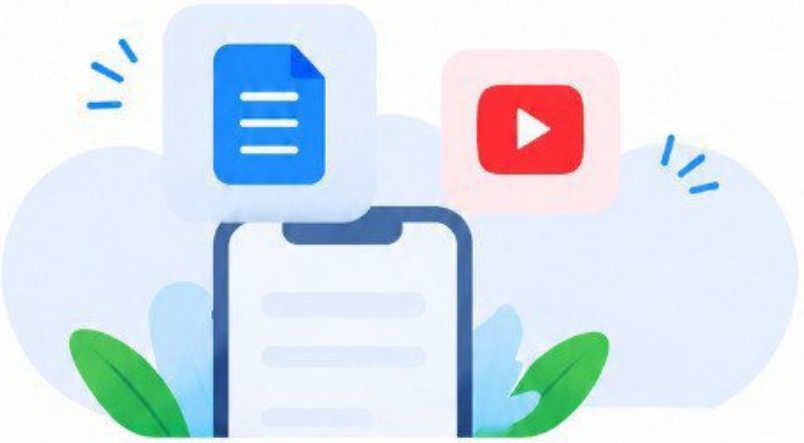

- **Evaporation:** The sun heats water in rivers, lakes, and oceans, turning it into water vapor (a gas).
- **Condensation:** The water vapor cools and changes into tiny water droplets, forming clouds.
- **Precipitation:** The droplets grow larger and fall to the Earth as rain, snow, or hail.
- **Collection:** The water gathers in rivers, lakes, oceans, and underground, and the cycle starts again.

Overview

A beginner-friendly introduction to renewable energy, including its main types, benefits, and role in a sustainable future.

Key Takeaways

- Understand what renewable energy is
- Explore common types (solar, wind, hydro, etc.)
- Learn its key benefits
- See why it matters for a sustainable future
